

Operating system

end user

- 1) Interface.
- 2) Resource manager / allocator
- 3) Control program.
- 4) CO/DVO → Core OS + Software + Utility software
- 5) kernel

IDE - Integrated development Environment

program - Set of instruction given to the computer → exe (executable file)

software - set of programs. → multiple executable file.

Utility - associated with OS.

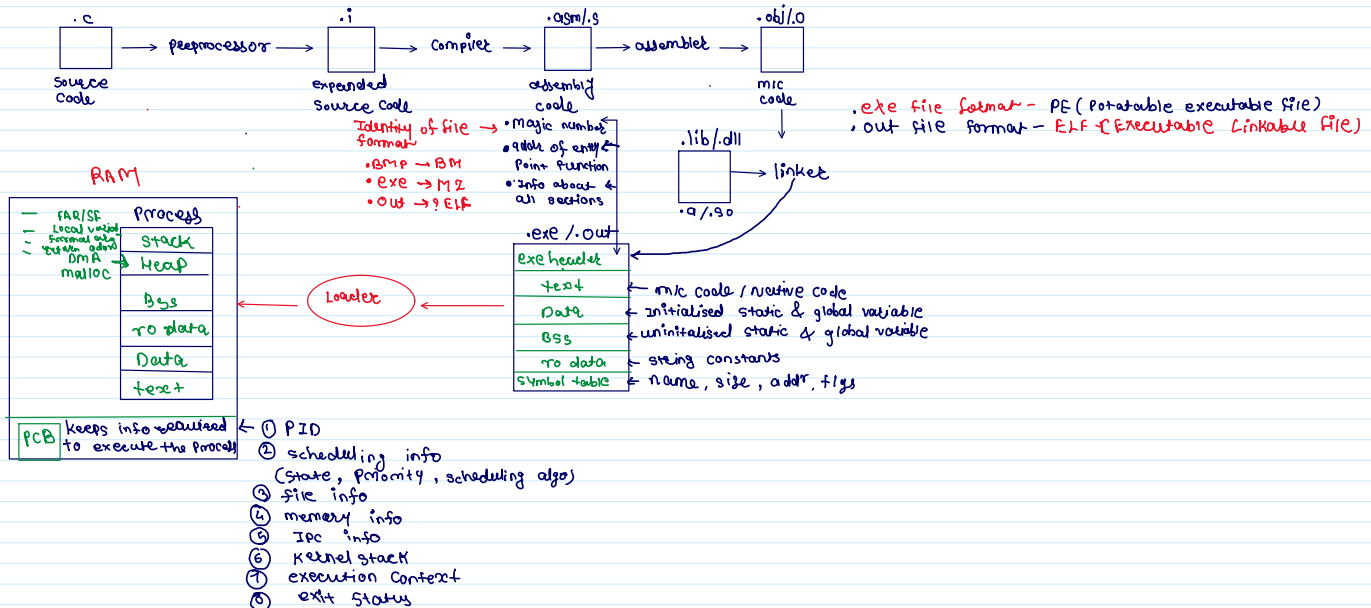

OS - interface between app's software and computer hardware

kernel functionalities.

- 1) process management.
- 2) CPU scheduling
- 3) file & io management
- 4) memory management
- 5) Hardware abstraction
- 6) user interfacing
- 7) networking
- 8) security & protection.

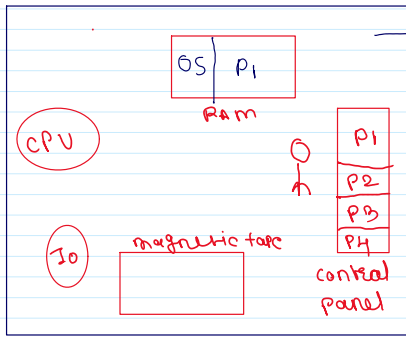

Process management

process → program in execution.

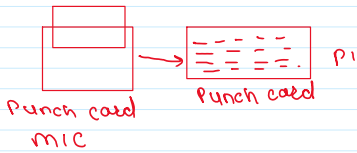

Evaluation of OS

mainframe Computer

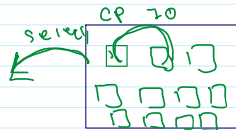

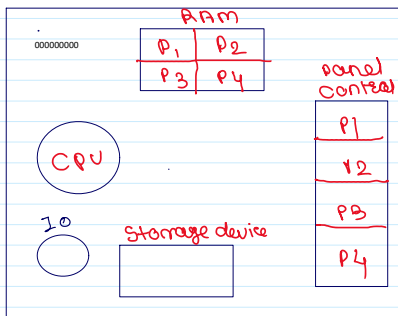

- ① Resident monitor
- ② batch system
- ③ multiprogramming SLM

$$\text{program} = \text{CPU time} + \text{I/O time} + \text{CPU bound} + \text{I/O bound}$$

multiprogramming SLM

Job scheduler - load the prog on the RAM

Degree of multiprogramming - no. of process kept in a memory

4

CPU scheduler - selects prog from RAM to CPU
