

1.

Which operating system allows a user to run multiple applications at the same time?

- A. Single-tasking Operating System
- B Real-Time Operating System (RTOS)
- C. Multi-tasking Operating System
- D. Batch Operating System

Answer: C

2.

Which of the following correctly shows the order of process states?

- A. New -> Running -> Waiting -> Terminated
- B. New -> Ready -> Running -> Terminated
- C. New -> Running -> ready -> Waiting
- D. Ready -> New -> Running -> Terminated

Answer: B

3.

What is the convoy effect in the operating system?

- A. When all processes are executed in parallel
- B. When a low-priority process delays high-priority ones
- C. When multiple short processes get stuck behind a long process
- D. When all processes enter critical section at the same time

Answer: C

4.

What is turnaround time?

- A. Time taken to respond to the first request**
- B. Time taken for process completion**
- C. Time spent waiting in the ready queue**
- D. Time spent in I/O**

Answer: B

5.

Which of the following is a data structure used by the kernel to manage processes?

- A. Process Control Block (PCB)**
- B. Ready Queue**
- C. Job Queue**
- D. All of the above**

Answer: D

6.

Which of the following is not typically stored in the Process Control Block (PCB)?

- A. Program counter**
- B. Page table**
- C. File descriptors**
- D. Network address**

Answer: D

7.

Which IPC mechanism is fastest in terms of data exchange between processes?

- A. Message Queue**
- B. Pipe**
- C. Shared Memory**
- D. Semaphores**

Answer: C
