

- ① Create a node.
- ② Assign the value to the data field.
- ③ Attach the node to the list.

a) If the list is empty.

```

If (head == NULL)
{
    head = ptr;
}
  
```

b) If linked list contains nodes

- 1) Take a trav pointer starting from the first node.
 - a. Struct node* trav = head;
- 2) Traverse till the last node.

```

While (trav->next != NULL)
    Trav = trav->next;
      
```
- 3) Attach the new node to the last node of the list.

```

Trav->next = ptr;
      
```

$400 \rightarrow \text{next} = 500$
 $\text{trav} \rightarrow \text{next} = \text{ptr};$

Best Case : If the list is empty : $O(1)$

Worst / Avg Case : $O(n)$
