

Q1: create TDate structure having data member day ,month , year and following functions

```
TDate(); TDate(int day,int month,int year); AcceptDate(); PrintDate_dd-mm-yyyy();
bool ValidateDate();
```

Q2:

Assignment Program namespace Define one namespace `na` having one data member `num1`. Define one global function `display_num()` access `num1` using namespace `na`. Inside main call `display_num()` function using scope resolution operator declare one global variable and one variable in main having same name, and try to access local variable and global variable Declare one variable in namespace and access thru main. Define two namespace having different variables defined and access thru main. Program to demonstrate global variable and using nested name space Create first namespace N1 (int n1,int n2) second namespace N2(int n1; Nested Namespace N3 int n3;) and declare one local variable to main `n1` and access all members of namespace through main. `n1,&n1 (local) ::n1,&::n1 (global) N1::n1, &N1::n1 (from namespace N1) N1::n2, &N1::n2 (from namespace N1) N2::n1, &N2::n1 N2::N3::n3, &N2::N3::n3`
