

1.

What is the purpose of a static data member in C++?

- A. To share data between multiple objects of a class**
- B. To make data members constant**
- C. To make data members mutable**
- D. To hide data members from outside access**

Answer: A

2.

What is the purpose of a static member function in C++?

- A. To access non-static data members**
- B. To be called without creating an object of the class**
- C. To modify the state of an non static data ,member of the object**
- D. To return a reference to the current object**

Answer: B

3.

What is the effect of declaring a data member as const in C++ ?

- A. It can be modified after initialization**
- B. It cannot be modified after initialization**
- C. It is shared between objects of a class**
- D. It is mutable**

Answer: B

4.

What is the effect of declaring a member function as const ?

- A. It can modify the state of an object**
- B. It cannot modify the state of an object**
- C. It is shared between objects of a class**
- D. It is static**

Answer: B

5.

What is the purpose of the mutable keyword in C++?

- A. To make data members constant**
- B. To make data members static**
- C. To allow modification of non constant data members in const member function**
- D. To hide data members from outside access**

Answer: C

6.

What is the benefit of using a modular approach in programming?

- A. It makes the code more complex**
- B. It makes the code more difficult to maintain**
- C. It allows for code reuse and easier maintenance**
- D. It reduces the performance of the program**

Answer: C
